Introduction to consumption-based carbon accounting and policies

Prof. Arnold Tukker,
Project Coordinator, TNO and
Leiden University - CML

Carbon-CAP Side Event, EU Pavillion, COP22, Monday 07-11-16

Concept: link territorial emission to a picture of global economic relations

- For now, we don't manage the 2° degree goal
- We now rely on industry perspective emission accounts and policies
- A consumption / value chain perspective can give additional levers to reach the goal

		Industries				$Y_{*,A}$	$Y_{*,B}$	$Y_{*,C}$	$Y_{*,D}$	q
Products		$Z_{A,A}$	$Z_{A,B}$	$Z_{A,C}$	$Z_{A,D}$	$Y_{A,A}$	$Y_{A,B}$	$Y_{A,C}$	$Y_{A,D}$	q_A
		$Z_{B,A}$	$Z_{B,B}$	$Z_{B,C}$	$Z_{B,D}$	$Y_{B,A}$	$Y_{B,B}$	$Y_{B,C}$	$Y_{B,D}$	q_B
		$Z_{C,A}$	$Z_{C,B}$	$Z_{C,C}$	$Z_{C,D}$	$Y_{C,A}$	$Y_{C,B}$	$Y_{C,C}$	$Y_{C,D}$	q_C
		$Z_{D,A}$	$Z_{D,B}$	$Z_{D,C}$	$Z_{D,D}$	$Y_{D,A}$	$Y_{D,B}$	$Y_{D,C}$	$Y_{D,D}$	q_D
W		W_A	W_B	W_C	W_D					
		g_A	g_B	g_C	g_D					
C & L Environ Ext		$Capital_A$	C_A	C_C	C_D					
		$Labor_A$	L_B	L_C	L_D					
		$NAMEA_A$	$NAMEA_B$	$NAMEA_C$	$NAMEA_D$					
		$Agric_A$	$Agric_B$	$Agric_C$	$Agric_D$					
		$Energy_A$	$Energy_B$	$Energy_C$	$Energy_D$					
		$Metal_A$	$Metal_B$	$Metal_C$	$Metal_D$					
		$Mineral_A$	$Mineral_B$	$Mineral_C$	$Mineral_D$					
		$Land_A$	$Land_B$	$Land_C$	$Land_D$					

Consumption/Value chain perspective:

- Consumption product $x = VA$ sector 1 + VA sector 2...
- Per sector we have CO2 emissions and production
- Emissions product $x = \text{Sum emissions per unit } VA$

...is hence simply re-distributing territorial emissions to final consumption categories

We use for this EXIOBASE, build in 4 major EU projects by my team including Carbon CAP

Territorial/Industry perspective:
Emissions & policies by sector

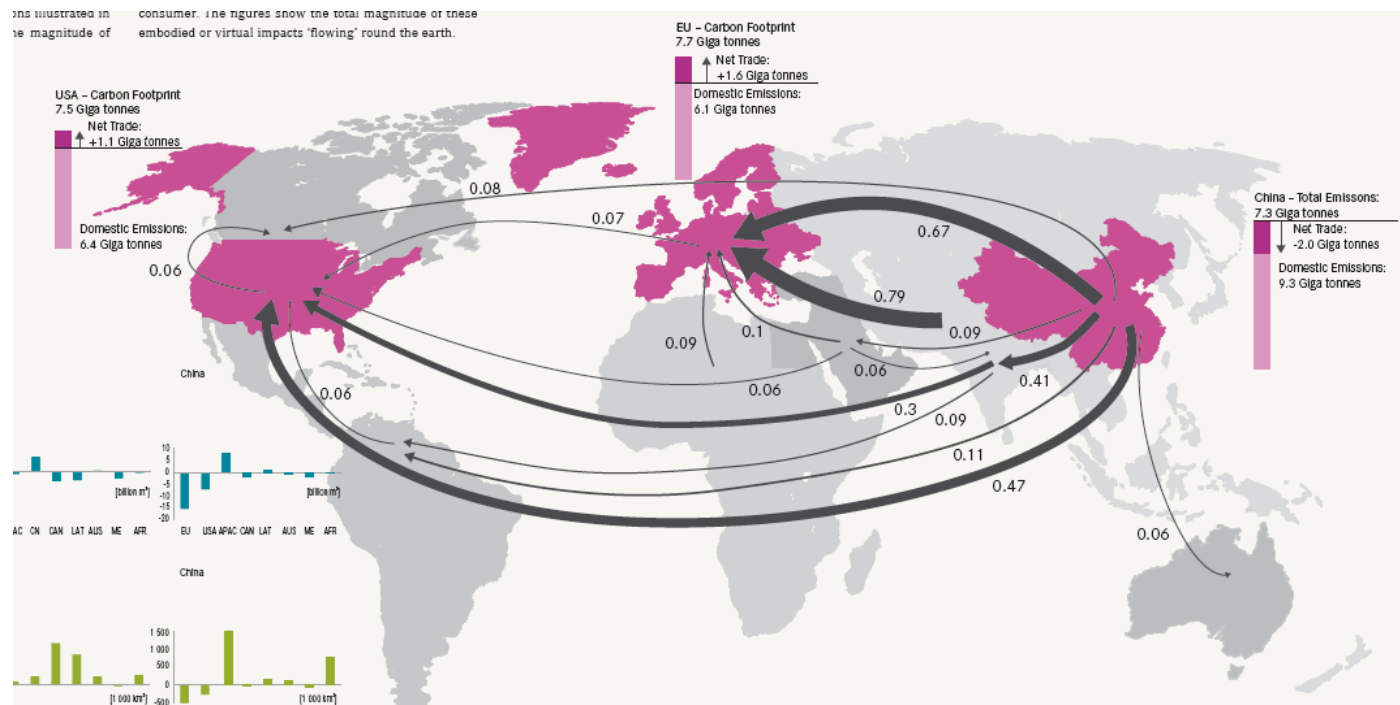

- Added value:
 - New perspective -> additional policies
 - Addressing consumption as a driver
 - Additional perspective on dividing responsibilities
- Relevance:
 - Consumption drives CO₂ emissions
 - Trade and embodied CO₂ grow quicker as GDP

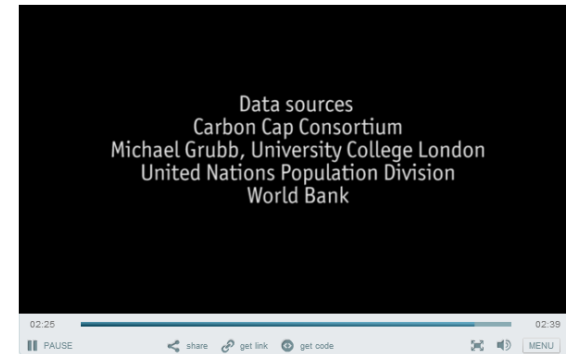

Example: carbon embodied in trade

- China exports 2 Gt embodied carbon...
- ..imported by the EU and US....
- ..but produced by often less resource-efficient industries and with high-carbon energy systems...

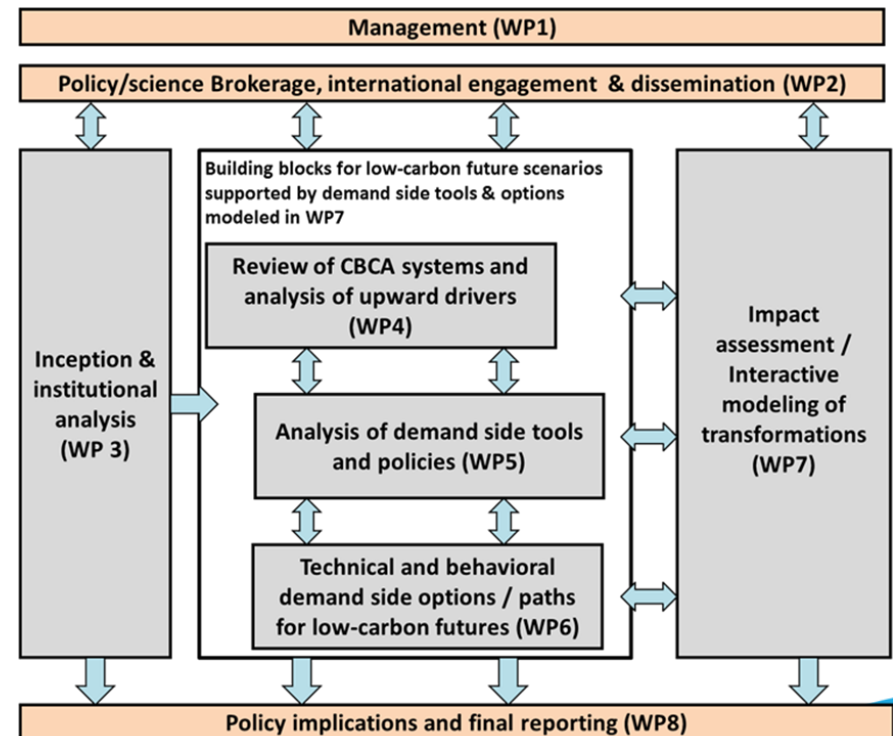

Carbon footprint per capita vs. GDP

<http://www.economist.com/news/international/21679288-china-and-india-are-perceived-be-worst-emitters-carbon-dioxide-see-what-happens-when-we>

Challenges and answers of Carbon CAP

- Uncertainty in accounting is unknown -> WP4
- Consumption – based policies are new and unknown -> WP5, WP6
- Added value of such policies is unknown -> WP7
- Hence not (yet) accepted for use in official contexts (UNFCCC, COP) -> WP2
- Indeed, fear uncertainties may block progress in negotiations

- In this session we hope to show
 - It is not fundamentally new
 - We re-distribute emissions per sector to consumption
 - Uncertainty is manageable: territorial emissions (!) and GDP dominate
 - This new perspective can lead to useful, additional policies
 - That Carbon CAP results may enhance acceptance of the consumption-based perspective...
 - ...supporting the 2^o goal

Uncertainties (work of Anne Owen, Leeds University)

Transactions within countries 20-30 %

Trade between countries 10-20%

		Industries				$Y_{*,A}$ $Y_{*,B}$ $Y_{*,C}$ $Y_{*,D}$				q
Products		$Z_{A,A}$	$Z_{A,B}$	$Z_{A,C}$	$Z_{A,D}$	$Y_{A,A}$	$Y_{A,B}$	$Y_{A,C}$	$Y_{A,D}$	q_A
		$Z_{B,A}$	$Z_{B,B}$	$Z_{B,C}$	$Z_{B,D}$	$Y_{B,A}$	$Y_{B,B}$	$Y_{B,C}$	$Y_{B,D}$	q_B

Consumption-based carbon accounts: towards a robust role in policy making

Prof. Arnold Tukker,
Project Coordinator, TNO and
Leiden University - CML

OECD ICOA Side Event, OECD Pavillion, COP25, Thursday 3
December, 2015

Concept: link territorial emission to a picture of global economic relations

- For now, we don't manage the 2° degree goal
- We now rely on industry perspective emission accounts and policies
- A consumption / value chain perspective can give additional levers to reach the goal

Industries					$Y_{*,A}$	$Y_{*,B}$	$Y_{*,C}$	$Y_{*,D}$	q
Products	$Z_{A,A}$	$Z_{A,B}$	$Z_{A,C}$	$Z_{A,D}$	$Y_{A,A}$	$Y_{A,B}$	$Y_{A,C}$	$Y_{A,D}$	q_A
	$Z_{B,A}$	$Z_{B,B}$	$Z_{B,C}$	$Z_{B,D}$	$Y_{B,A}$	$Y_{B,B}$	$Y_{B,C}$	$Y_{B,D}$	q_B
	$Z_{C,A}$	$Z_{C,B}$	$Z_{C,C}$	$Z_{C,D}$	$Y_{C,A}$	$Y_{C,B}$	$Y_{C,C}$	$Y_{C,D}$	q_C
	$Z_{D,A}$	$Z_{D,B}$	$Z_{D,C}$	$Z_{D,D}$	$Y_{D,A}$	$Y_{D,B}$	$Y_{D,C}$	$Y_{D,D}$	q_D

- ..imported by the EU and US....
- ..but produced by often less resource-efficient industries and with high-carbon energy systems...

Carbon footprint per capita vs. GDP

<http://www.economist.com/news/international/21679288-china-and-india-are-perceived-be-worst-emitters-carbon-dioxide-see-what-happens-when-we>

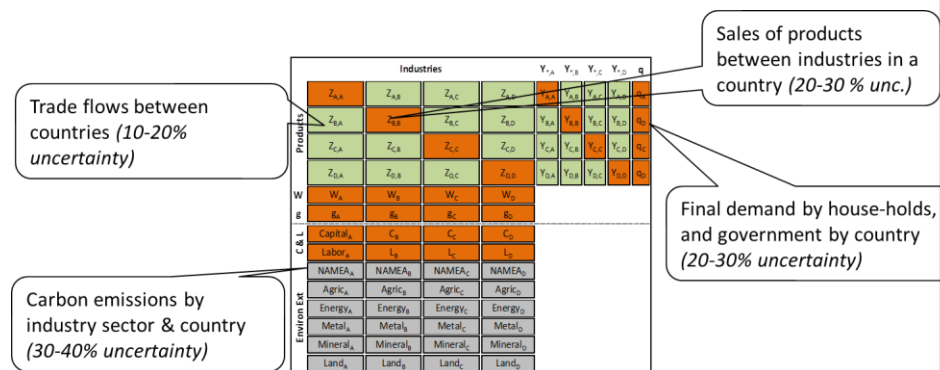

- Potential CBA & CBCP
 - Additional perspective on how to share responsibilities
 - Addresses consumption as a driver
 - May give clues for developing more efficient policies
- What are the challenges
 - Uncertainty: negotiations blocked by discussion over data
 - Options and policies not yet clear
 - Added value of policies not yet clear
 - That is what we analyse in Carbon CAP/EXIOBASE

Main gaps

- Now 5 main global databases

- EXIOBASE
- EORA
- GTAP
- WIOD
- ICOA

- Stunning finding about differences in carbon footprint per country
 - Territorial emissions: 30-40%
 - Final demand (GDP as % of global): 20-30%
 - National IO part: 20-30%
 - Trade: 10-20% (higher for small countries)

- Science can improve main uncertainties
 - Harmonize emission data
 - Harmonize final demand
 - Use integration procedures that keep national IO tables intact
 - Talk with NSIs about main discrepancies in trade
 - But take care: for carbon you can work with aggregated tables, for water, land, resources not
- We also we need to move to something more official too
 - NSIs, Eurostat, OECD, UN SD are hesitant to adjust country tables -> always an aggregated common denominator
 - Maybe: OECD, or UN SD makes an aggregated semi-official GMRIO
 - Scientists then apply their detailing procedures

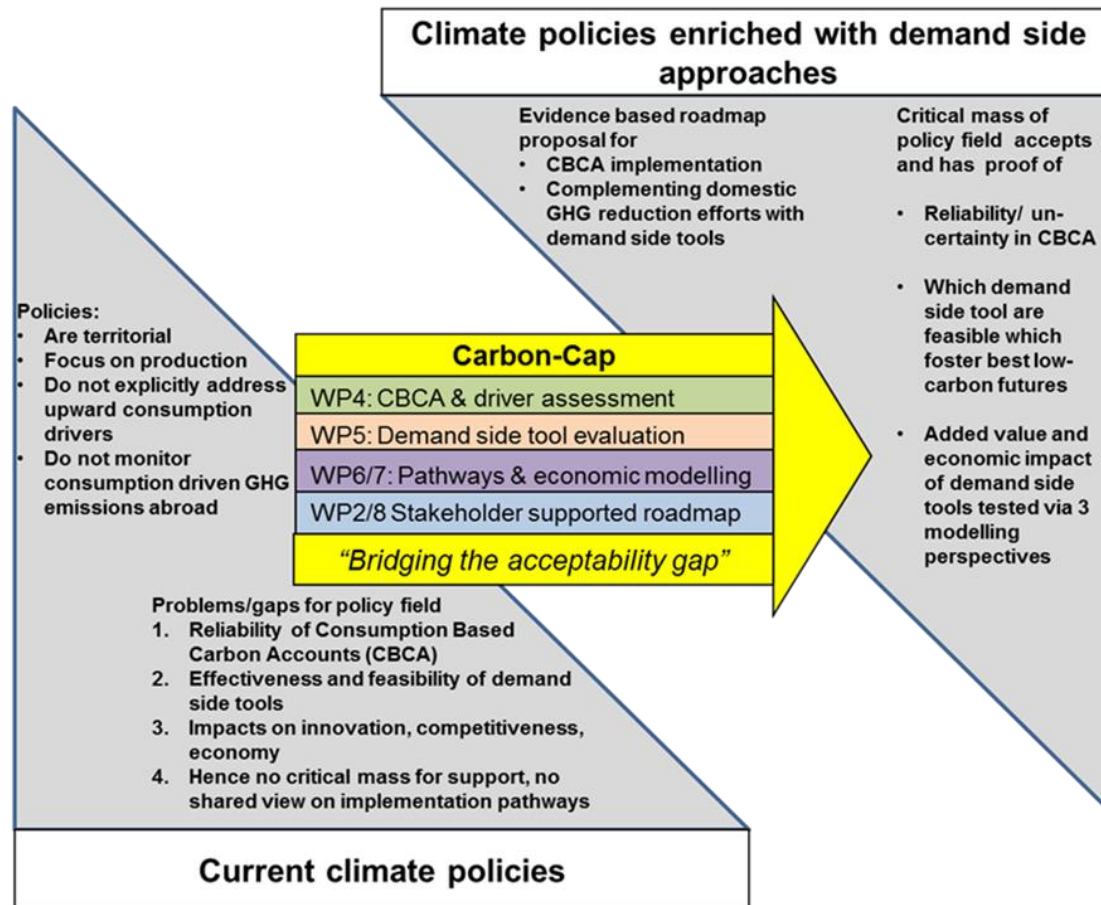

Thank you for being here today!

Leftover slides

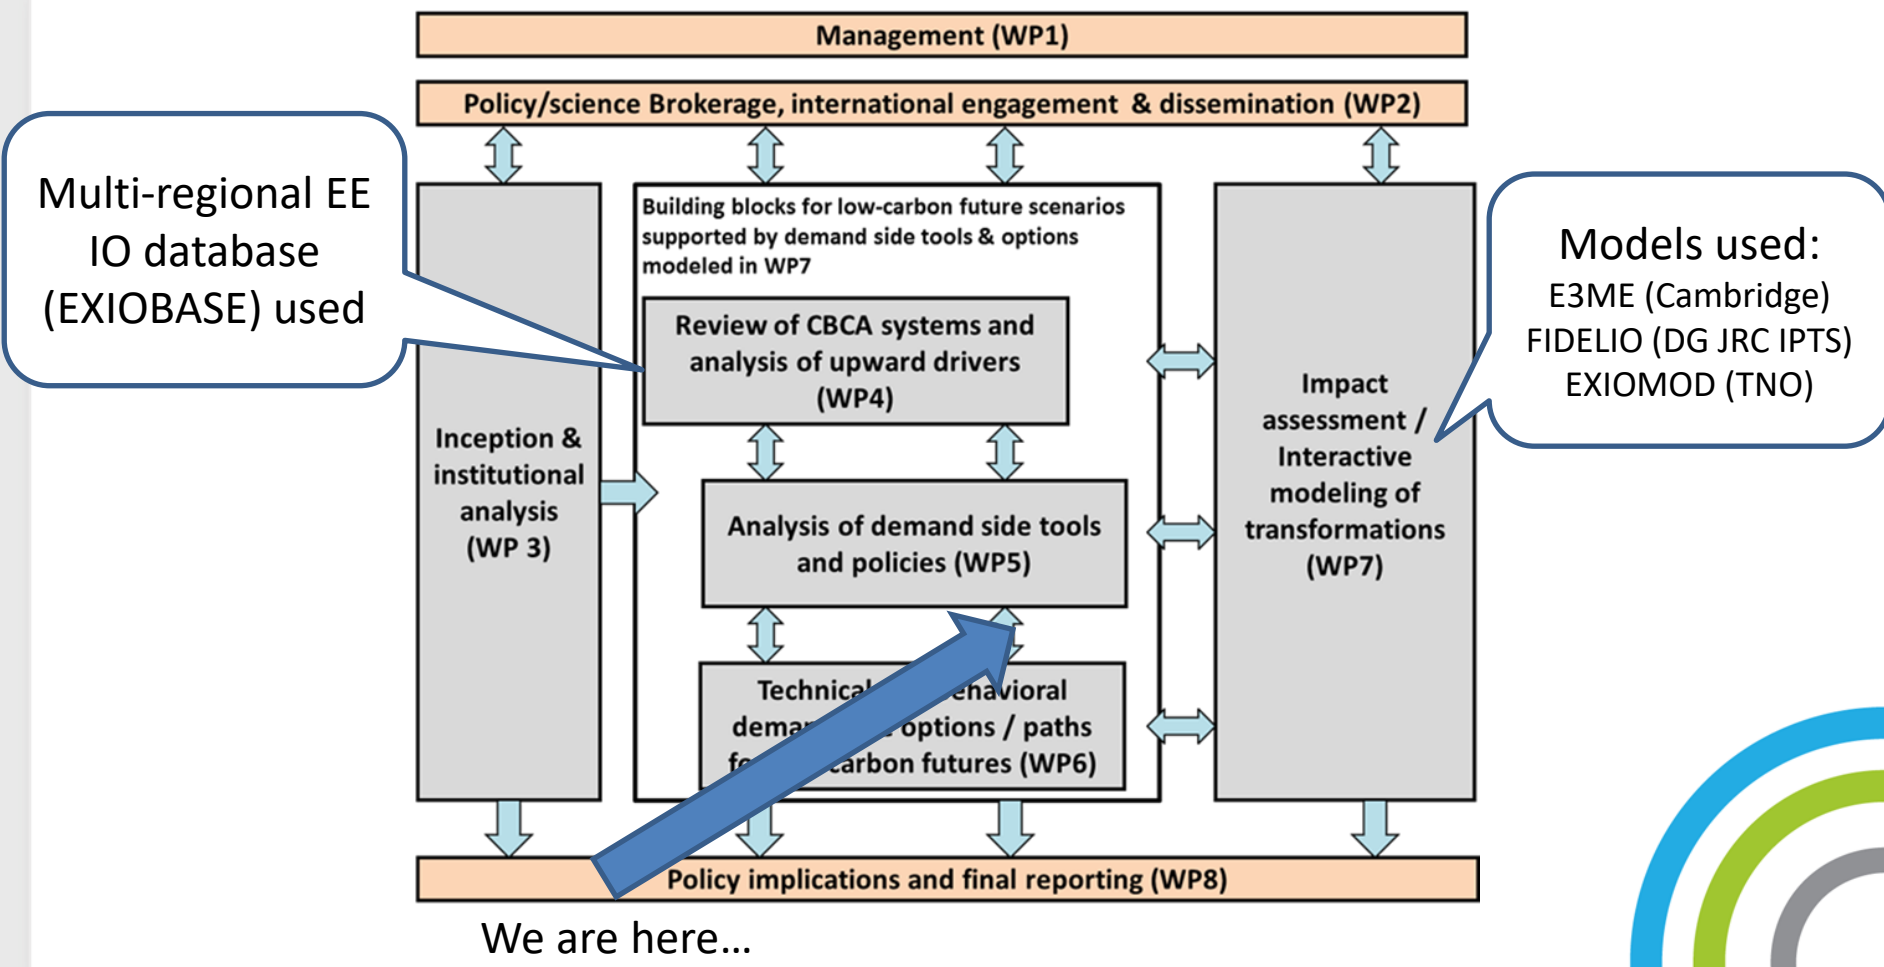

Work Breakdown

Main gaps

- Gap 1 (*WP4, Multi-regional input output analysis*): Can we make consumption-based carbon accounts? With what (un)certainty? [
- Gap 2 (*WP5, 6: Options and policies*): What demand-side carbon options and policies can we identify?
- Gap 3 (*WP7: environmental & economic modelling of traditional and consumption oriented policy scenarios*): How effective and acceptable are they?
- Gap 4 (*WP2, 8: stakeholder discussions & integrated conclusions*): How do we come to a shared view of added value of consumption – based accounts and policies?

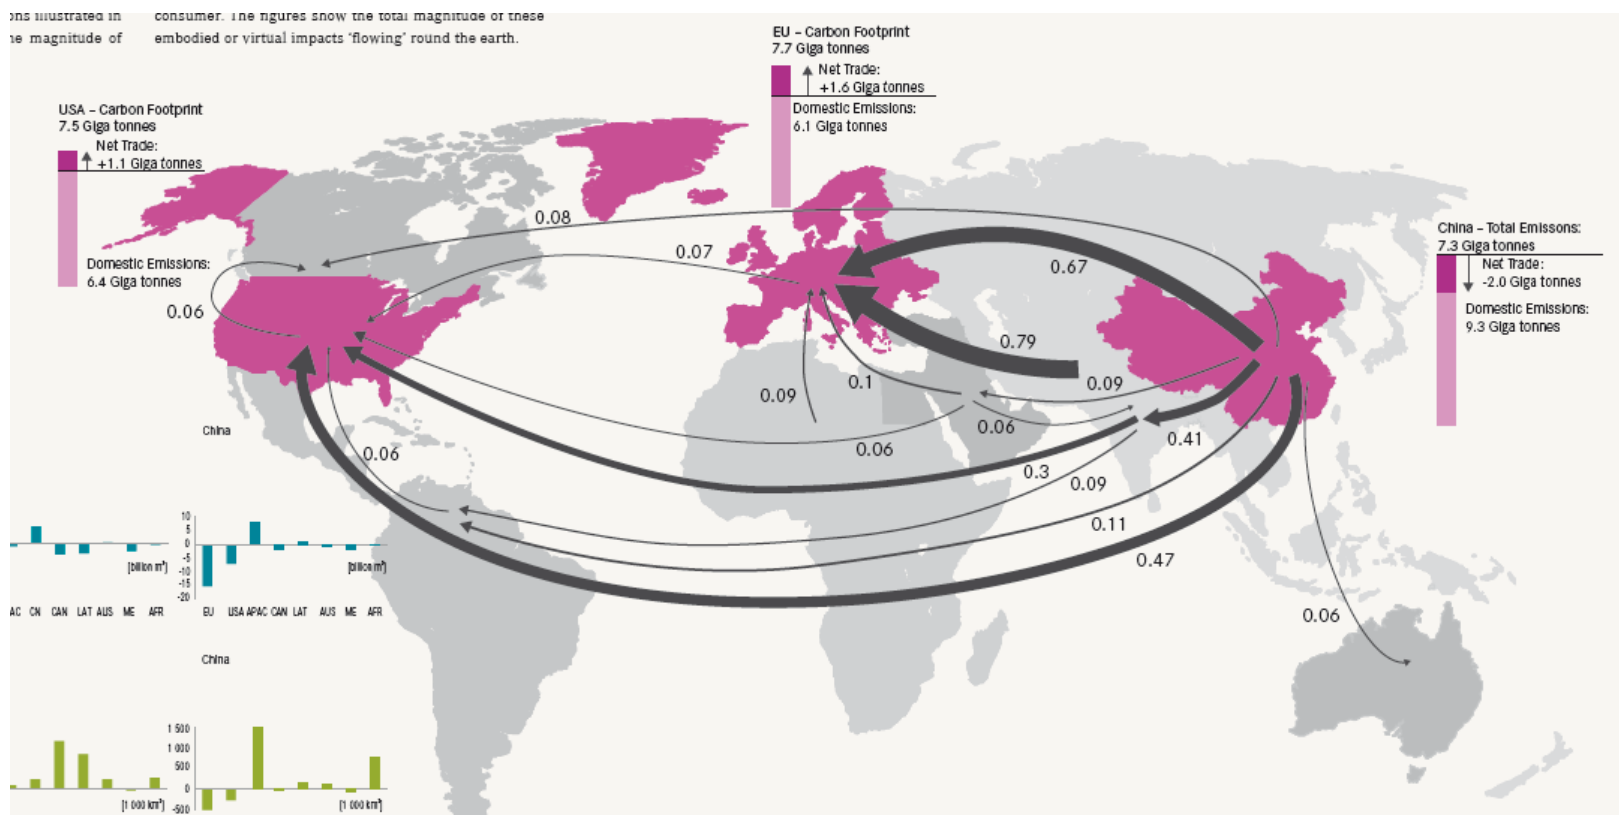

- Territorial and consumption based carbon emissions by continent

- Carbon footprint rankings by country

- Carbon embodied in trade

- Carbon CAP sets consumption central
- Wants to overcome 4 main gaps
 - Uncertainty
 - Understanding of possible policies
 - Understanding of effectiveness of policies
 - Creating a common view on usefulness
- Via
 - Analysis with MRIO time series
 - Identification of policy options
 - Identification of technical and behavioral options
 - Assessment of the economic and environmental implications of traditional and consumption oriented policy scenarios via 3 models
 - Intensive stakeholder interaction

Questions so far?

An introduction to the concept of consumption based emissions accounting and related policies

Prof. Arnold Tukker,

Project Coordinator, TNO and Leiden University - CML

Addressing consumption-based emissions: the Chinese perspective

Event co-organised by Carbon CAP and the Climate Group, Beijing, 10
November 2015
